Siting Tool for Advanced Nuclear Development - STAND

What is it?:

- An integrated tool used to help identify and compare possible siting locations inside the continental U.S. for advanced nuclear facilities based on factors related to Socioeconomics, Proximity, and Safety

A tool to help answer the question of “Where?” and “Why there?”

Siting Tool for Advanced Nuclear Development - STAND

Provides a systematic way based on user siting preferences and priorities to:

Discover areas that may be a good fit

Explore areas to identify specific sites

Compare sites to identify an optimal option

Siting Tool for Advanced Nuclear Development - STAND

Factors

- 3 categories of factors are considered based on user priorities and preferences

Factors	Definition
Socioeconomic	Social, economic, and local energy policy factors that could potentially influence state and local acceptance of construction and operation of the facility.
Proximity	Environmental and regulatory exclusion zone criteria, distances to infrastructure that could facilitate or support construction and operation of the facility.
Safety	Regulatory guidelines for environmental and geologic safety factors, safety risks, mitigation approaches.

Meet STAND

Siting Tool for Advanced Nuclear Development

Use STAND to identify and examine potentially feasible sites where advanced nuclear facilities might be welcomed by host communities. STAND is designed to explore and provide insight on socioeconomic, proximity, and safety data, generate county reports, review regulatory data, and complete a comparative analysis across multiple sites. However, STAND is not a substitute for the in-depth studies required to qualify a site for hosting a nuclear facility, nor is it a substitute for the necessary community engagement to build trust and seek consent. STAND is best used for the contiguous United States. Data availability is limited in Alaska and Hawaii. STAND does not currently support analysis of U.S. Territories.

Get Started

Site Discovery

Start here if you want to identify counties or states that may be candidates for reactor deployment.

Site Exploration

Start here if you have already identified general areas for deployment but would like to explore regulatory data or drop points.

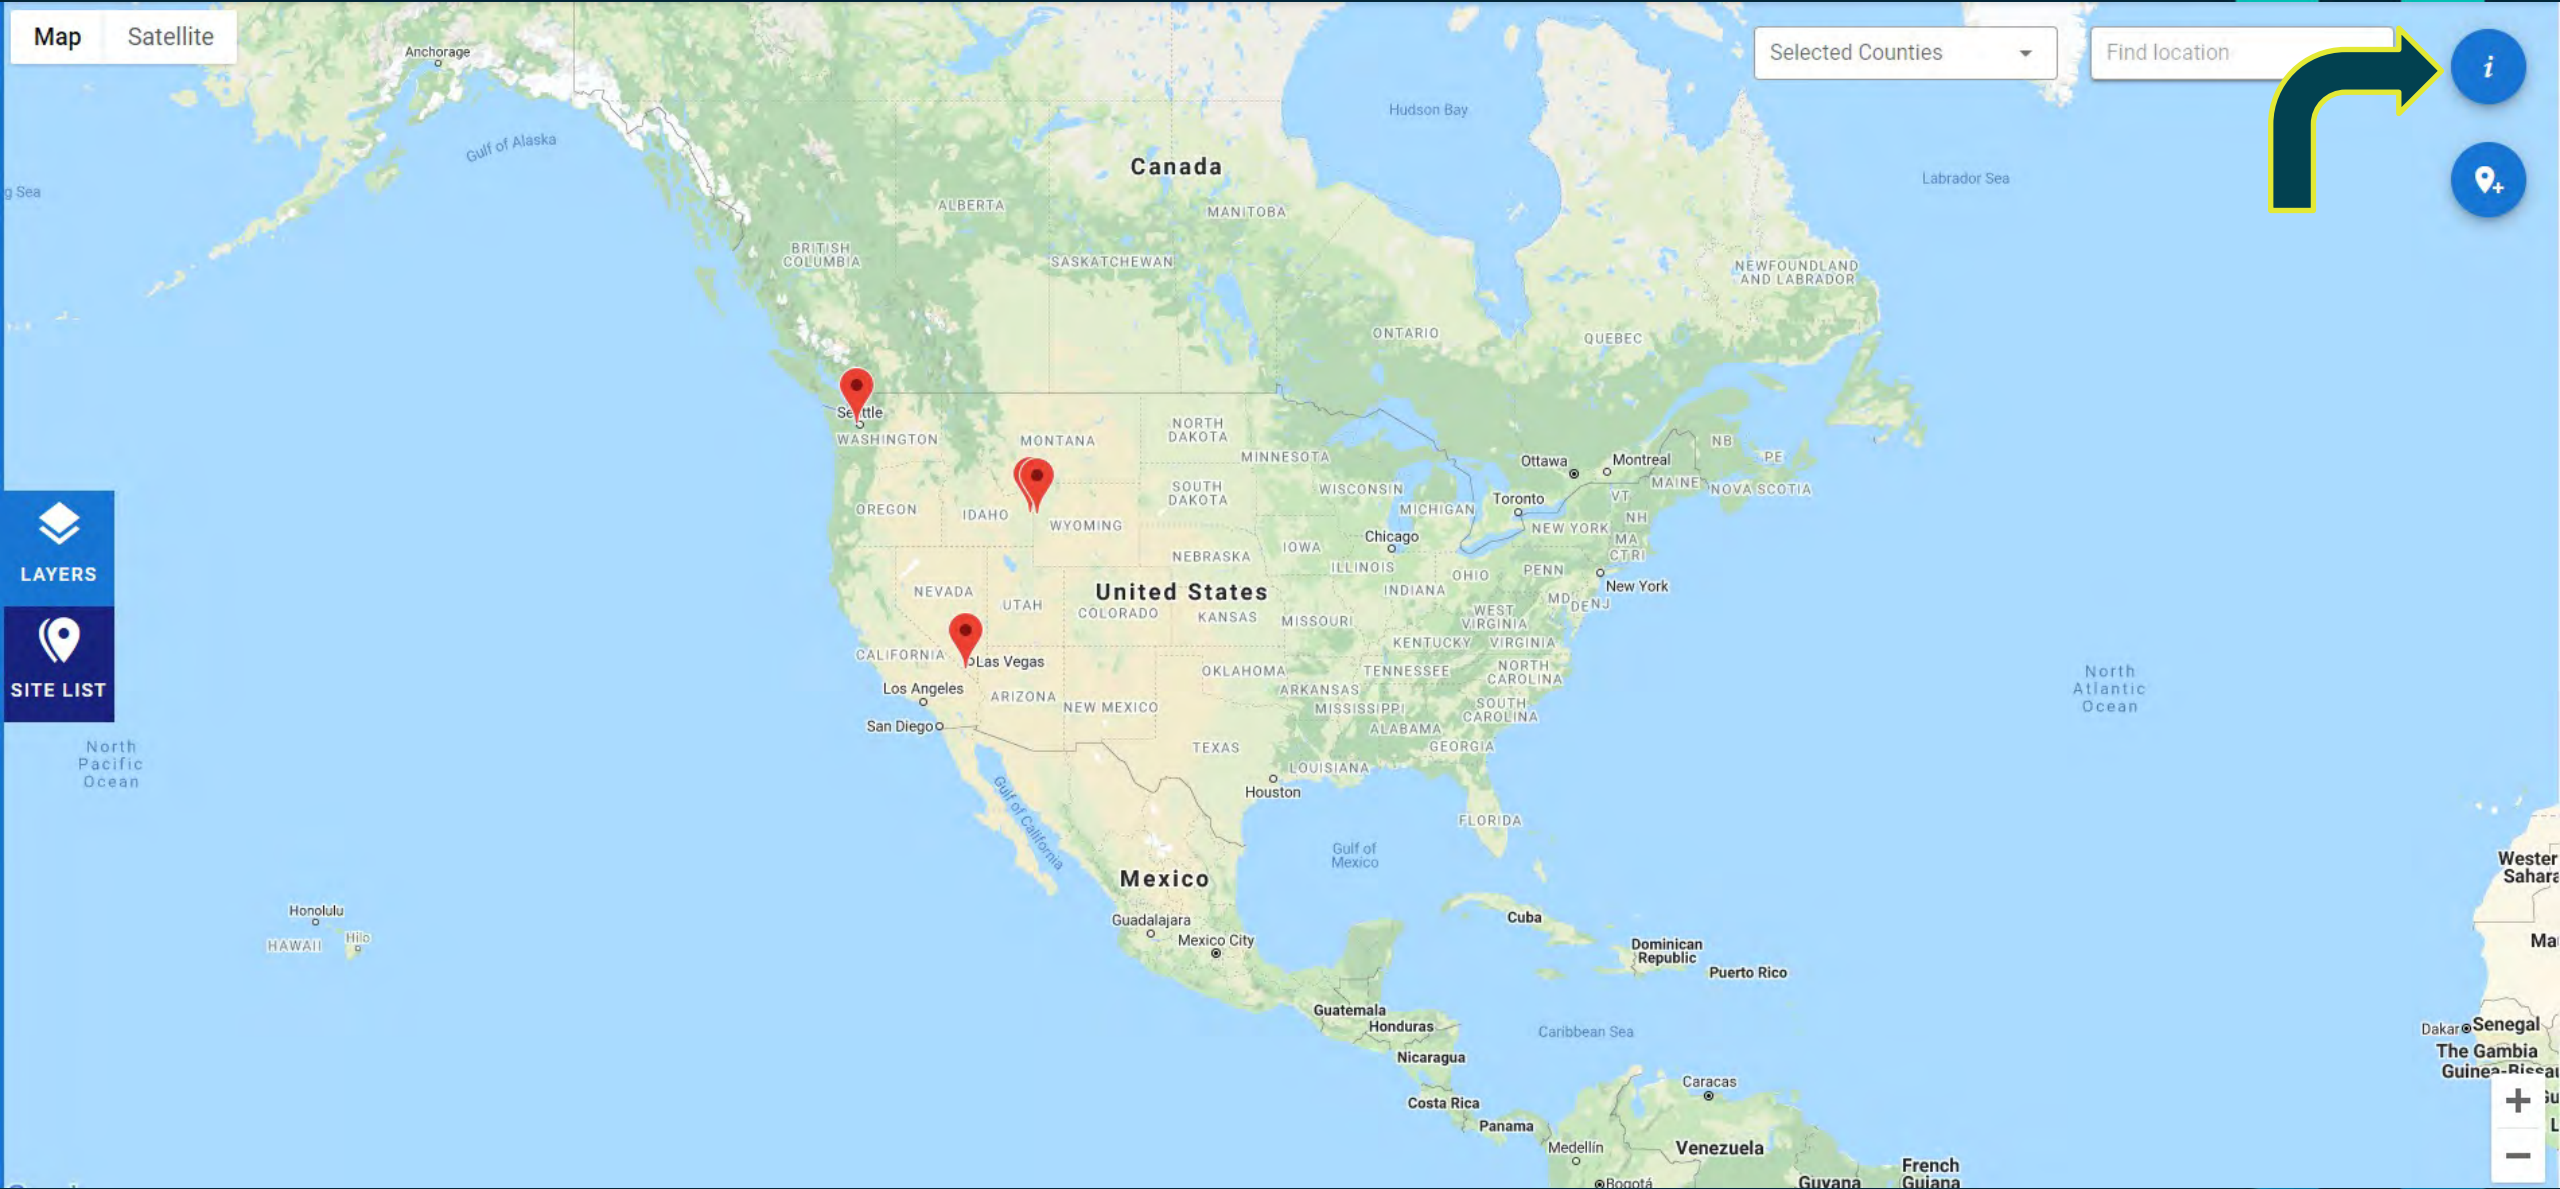

Site Comparison

Start here if you have identified site coordinates for deployment and would like to compare them against each other.

User-friendly Guidance Features

- Page Level Information Boxes
- Indicator Level Information Boxes
- Reference Maps

Site Exploration

Site Exploration displays a web GIS which can be used to explore regulatory and/or infrastructure data and select locations for Site Comparison.

How To Use This Section:

1. Choose locations for exploration:
 - a. If counties have been selected in Site Discovery, these counties can be accessed in the dropdown titled "Selected Counties" in the upper right of the map frame. This will zoom the map to the selected counties.
 - b. The "Find Location" box in the upper right of the map frame will zoom to any user defined location. User defined locations can be; states, counties, cities or addresses.
 - c. Adjust the zoom with the +/- icon on the left of the map. Reposition by clicking and dragging.
2. View data layers:
 - a. Click on the "Layers" tab on the left side of the screen to open the layers drawer. Use the dropdowns to display the available layers for each category.
 - i. Use checkboxes to display layers in the map. Multiple layers can be selected and viewed simultaneously. Layers that display "Zoom in" below the layer name require the map to be zoomed further in in order to be displayed.
 - ii. Click the information boxes to display layer information.
3. Add sites for Site Comparison:
 - a. Click the add sites icon on the right side of the map frame to add sites:
 - i. Once the icon has been clicked, it will turn red to indicate it is active. Click it again to deactivate or the next click on the map will add a new site.
 - ii. If a new site is added, a dialog box will appear. Input the name of the site and submit by clicking save to list.
 - b. Once sites have been added, click on the "Site List" tab on the left side of the screen to open the site list drawer.
 - i. Click the blue site name to zoom to that site in the map pane.
 - ii. Use the garbage can icon to remove the site from the list.
 - iii. Once all sites have been added, click the green "Compare Sites" button to proceed to Site Comparison where all sites added will be automatically displayed.

Reference Map Not Available

31

35

40

Safe Shutdown Earthquake

Land with safe-shutdown earthquake (SSE) peak ground acceleration (2% chance in a 50 year return period) between .1g - .6 g. The SSE peak ground acceleration (2% chance in a 50-year return period) greater than the selected threshold parameter value is flagged. This value is variable within the database and can be adjusted based on technology. SSE =0.3 g is suggested for LWRs. SSE =0.5 g is suggested for SMRs.

WHY IT MATTERS

The 2002 EPRI siting guidance recommended limiting large LWR technologies to less than 0.3 g safe shutdown earthquake peak ground acceleration. As SMRs and advanced reactor technologies allow for more seismic mitigation through design, the OR-SAGE threshold parameter for seismic activity has been set slightly higher at 0.5 g safe shutdown earthquake peak ground acceleration. Mitigating design features may include smaller footprints, smaller piping systems, passive safety systems, underground installation, and improved seismic isolation

Priority Questionnaire

Answer the questions below to identify counties with the best conditions for deploying your advanced nuclear reactor technology. Results will be based on your priorities.

1. Which state nuclear restrictions would you consider dealbreakers for your project? ⓘ

- Moratorium (i.e. ban)
- Required approval by state legislature
- Required approval by the state Commissioner of Environmental Protection
- Voter approval
- Finding (i.e. proof) that the construction of a nuclear facility will be economically feasible for ratepayers
- Demonstrable technology or a means for high level waste disposal or reprocessing
- Finding that the proposed method for disposal of radioactive waste material (to be produced or generated by the facility) will be safe

[View Nuclear Restrictions Reference Map](#)

2. How important is high state energy price? ⓘ

Medium ▼

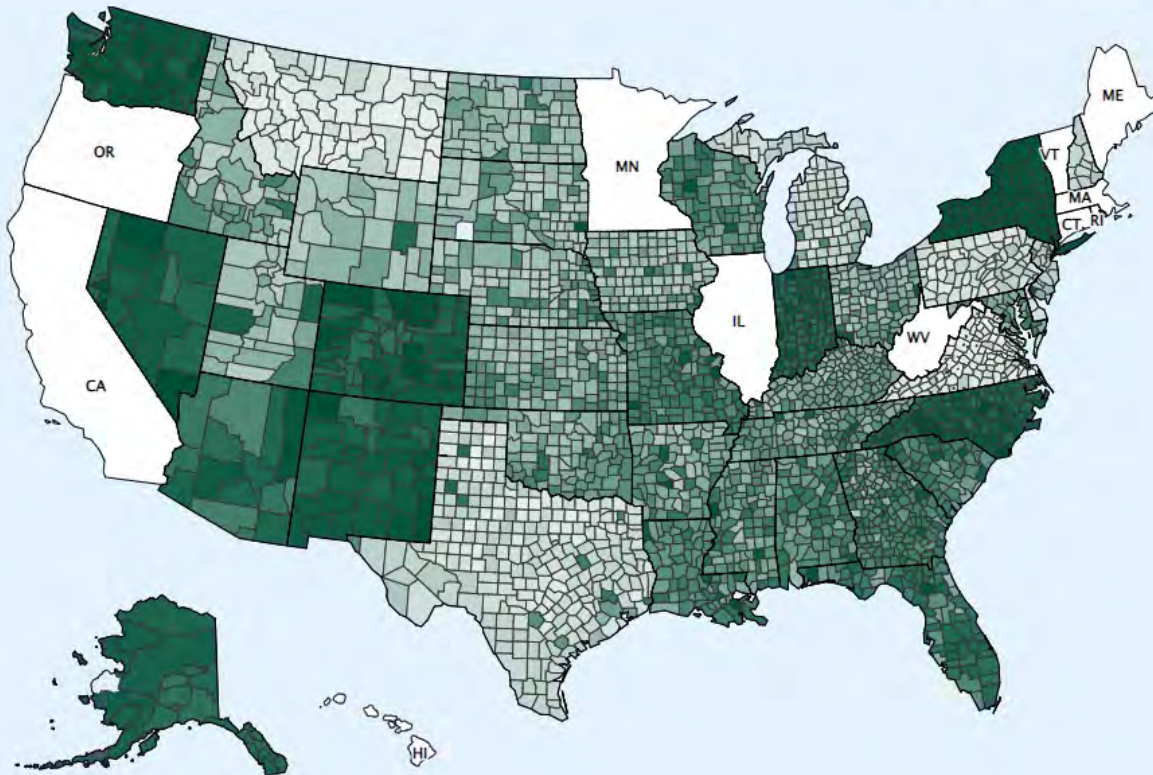

[View Energy Price Reference Map](#)

3. How important is state electricity market regulation? User can select deregulated or traditionally

Priority Match Map

This custom heat map shows the Development Rank for each county based on your priorities. Click a county to see ranking details, select a county to analyze, or download a report.

OR-SAGE: Oak Ridge Siting Analysis for Power Generation Expansion is a geographical information system (GIS) process tool

- **Objectives:**

- Use industry-accepted parameters for screening
- Use array of GIS data sources and spatial modeling capabilities at ORNL

- **Approach:**

- Adapted 10 CFR 100 requirements (through application of NRC RG 4.7 siting guidance and 2002 EPRI Siting Guide screening criteria) for nuclear power plants to GIS technology
- Use ~ 50 datasets to scan the contiguous U.S. (~1.8 billion acres) using 100 m by 100 m grid cells (2.5 acres)
- Results in a searchable land database of ~ 700 million cells

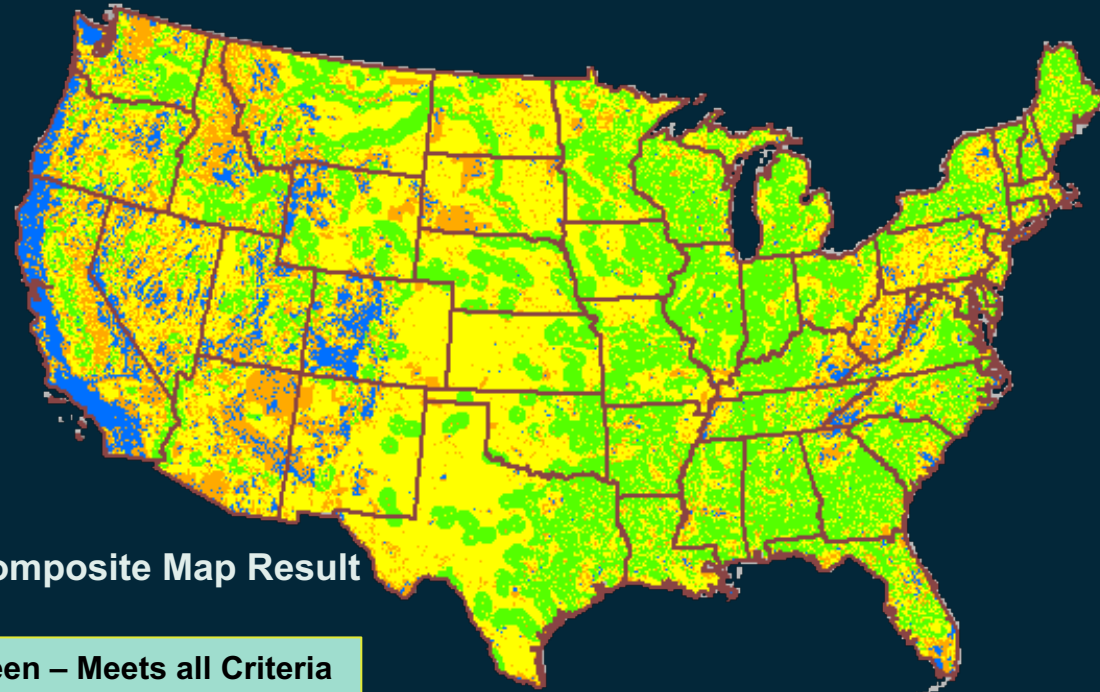

NRIC

FASTEST PATH TO ZERO
UNIVERSITY OF MICHIGAN

OR-SAGE is typically used to provide informative visual results on a national, regional, or local scale

Green – Meets all Criteria
Yellow – Single issue
Orange – Two issues
Blue – 3+ issues

Single issue potential:
Yellow + Green = 74.7%
potentially meets criteria

OR-SAGE provides capability to
interrogate any cell to evaluate status.

Base Map – 33.4% of US meets all criteria

Aggregate for 50-acre sites – 26.9% of US meets all criteria

OR-SAGE provides pre-processed data to STAND for use in the Exploration and Comparison phases

OR-SAGE Screening Parameters Available in STAND	Values Offered
Population density (people/square mile)	Area > 500 ppsm within 2, 5, or 10 miles (2018 data or 2030 projection)
Protected Lands (roll-up layer)	Wide variety of subsets to select from
Proximity to hazards (roll-up layer)	Airports; military facilities; chemical and energy facilities that pose a fire, missile, or toxic gas hazard
Landslide hazard (moderate or high)	Area flag based on USGS soil risk data
Proximity to surface faults	Set buffer distance based on fault length as determined by 10 CFR 100, Appendix A, Table 1
Safe shutdown earthquake (peak ground acceleration)	Area > 0.3, 0.4, 0.5, or 0.6 g
Slope	Area > 12% or 18% grade
100-year floodplain	Area in floodplain
Wetlands/Open water	Area in designated wetland and in open water

Summary of OR-SAGE - STAND interaction

- In the Exploration phase of STAND, the impact and sensitivity of various siting parameters can be explored around sites of interest
 - Only parameters of interest at values of interest need be selected
- In the Comparison phase of STAND, the relevance of the available siting parameters based on user weighting can be assessed across sites of interest

Site Comparison

Site comparison uses a multi-objective evaluation model as a structured framework for identifying which proposed sites best maximize the attributes that the user values.

Objectives and Performance Characteristics

Objectives

Attributes

Preferences

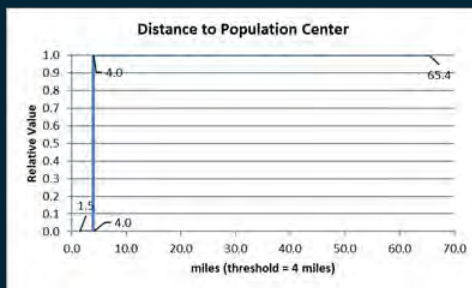

Value Functions

Site comparisons are structures around three objectives, each of which contains multiple attributes that describe the performance characteristics of the sites.

Objective	Attribute	Units
Socioeconomic	Electric Energy Price	cents/kWh
	Net Electricity Imports	million kWh/yr
	State Energy Policy	Positive; Neutral; Negative
	Nuclear Sentiment	% Fav. Toward Nuclear
	Construction Labor Index	Index
	etc....	
Proximity	Proximity to Nuclear R&D	Number within 100 miles
	Distance to Major Road	miles
	Distance to Rail Transport	miles
	Distance to Cooling Water	miles
	Distance to Transmission Substation	miles
	etc....	
Safety	Max Ground Acceleration > 0.5 g	No = not present; Yes = present
	Proximity to Fault Lines	No = not present; Yes = present
	100-Year Floodplain	No = not present; Yes = present
	Landslide Hazard	No = not present; Yes = present
	Open Water or Wetlands	No = not present; Yes = present
	etc....	

Value Functions

“Value functions” convert performance characteristics, in many different units, to a single measure of relative value so they can be weighted and summed to give an overall measure of site performance.

It is customary to assign the worst performance a relative value of 0 and the best performance a relative value of 1.

User Preferences are Reflected in “Weights”

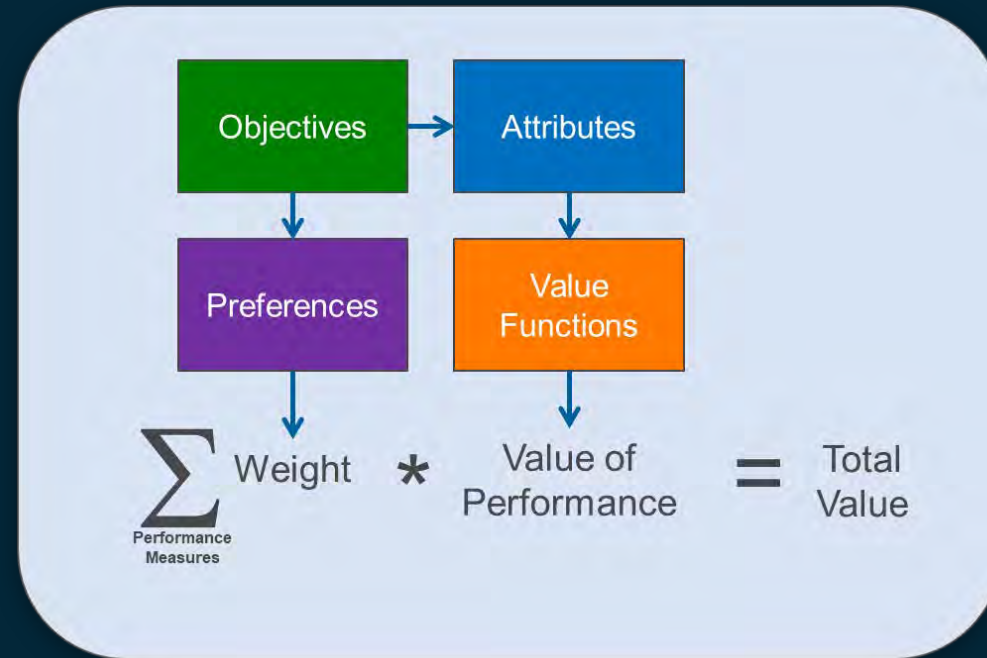

Weights reflect how relevant (important) each site characteristic is to site selection and how significant (sensitive) the performance difference is across the alternative sites.

Relevance - Significance Matrix (Showing highest cell weight)		Measure Relevance (intuitive)					Not Relevant
		Very High	High	Medium	Low	Very Low	
Performance Range Significance (factual)	Very High	100	90	80	70	60	
	High	90	80	70	60	50	
	Medium	80	70	60	50	40	
	Low	70	60	50	40	30	
	Very Low	60	50	40	30	20	
	Not Significant						

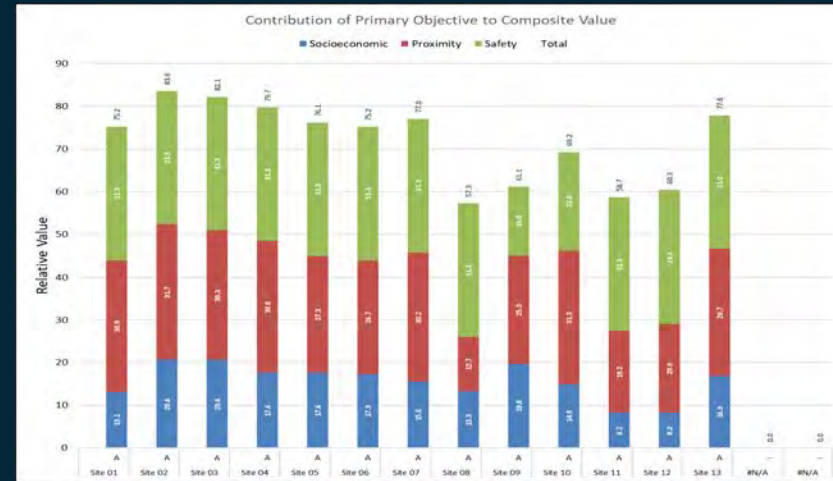

- Measure Relevance
 - How important is the measure in your selection of a site?
 - How much do you care about the measure?
- Range Significance
 - How great is the measure difference between the best and worst cases?
 - If the measure is the same for all sites, Range Significance = 0

Site Comparison

Site Comparison Results

Site comparison results are displayed in various graphical forms that enable the user to easily understand the results.
